Aminosalicylamides

JG13 Rec'd PCT/PTO 12 FEB 2002

5 The invention relates to known and novel acylaminosalicylamides, to a plurality of processes for their preparation and to their use for controlling plant-damaging organisms, and also to novel intermediates and processes for their preparation.

10 Certain aminosalicylamides, and their fungicidal action, are already known (compare, for example, WO 97-08135, WO 98-41513 or WO 99-27783). However, the activity of these prior-art compounds is, in particular at low application rates and concentrations, not entirely satisfactory in all areas of use.

It has now been found that the acylaminosalicylamides of the general formula (I),

15 in which

R¹ represents hydrogen or alkyl,

20 R² represents hydrogen or alkyl, or

in which

A represents oxygen, sulphur or -(N-R⁹)- in which

R^9 represents hydrogen or alkyl or together with R^6 and the nitrogen atom to which they are attached forms an optionally substituted heterocyclic ring,

5 R^4 represents hydrogen, optionally substituted alkyl or optionally substituted aryl or

R^2 and R^4 together with the atoms to which they are attached form a heterocyclic ring,

10

R^5 represents hydrogen or alkyl or

R^4 and R^5 together with the carbon atom to which they are attached form a carbocyclic ring,

15

R^6 represents hydrogen or in each case optionally substituted alkyl, cycloalkyl, aryl or heterocyclyl,

R^7 represents hydrogen or alkyl,

20

R^8 represents hydrogen or alkyl and

Z represents hydrogen or in each case optionally substituted alkyl, alkylcarbonyl, cycloalkyl, cycloalkylcarbonyl, aryl, arylcarbonyl, heterocyclyl or heterocyclylcarbonyl,

25

are suitable for controlling organisms causing damage to plants and industrial materials. These organisms are to be understood as meaning, in particular, microorganisms.

30

In the definitions, the hydrocarbon chains, such as alkyl, alkylene, alkenyl or alkynyl, are in each case straight-chain or branched, including in combination with heteroatoms, such as in alkoxy, alkylthio or alkylamino. Unless stated otherwise, preference is given to hydrocarbon chains having 1 to 6 carbon atoms.

5

Halogen generally represents fluorine, chlorine, bromine or iodine, preferably fluorine, chlorine or bromine, in particular fluorine or chlorine.

10

Aryl represents aromatic, mono- or polycyclic hydrocarbon rings, such as, for example, phenyl, naphthyl, anthranyl, phenanthryl, preferably phenyl or naphthyl, in particular phenyl.

15

Heterocyclyl represents saturated or unsaturated, and also aromatic, cyclic compounds having up to eight ring members in which at least one ring member is a heteroatom, i.e. an atom different from carbon. If the ring contains a plurality of heteroatoms, these can be identical or different. Preferred heteroatoms are oxygen, nitrogen and sulphur. If the ring contains a plurality of oxygen atoms, these are not directly adjacent. If appropriate, the cyclic compounds form, together with further carbocyclic or heterocyclic, fused-on or bridged rings, a polycyclic ring system. Preference is given to mono- or bicyclic ring systems, in particular to mono- or bicyclic aromatic ring systems.

20

Cycloalkyl represents saturated carbocyclic cyclic compounds which form, if appropriate, a polycyclic ring system with other carbocyclic, fused-on or bridged rings.

25

Cycloalkenyl represents carbocyclic cyclic compounds which contain at least one double bond and which form, if appropriate, a polycyclic ring system with other carbocyclic, fused-on or bridged rings.

30

Halogenalkoxy represents partially or fully halogenated alkyl. In the case of polyhalogenated halogenoalkoxy, the halogen atoms can be identical or different.

Preferred halogen atoms are fluorine or chlorine, in particular fluorine. If the halogenoalkoxy carries further substituents, the maximum possible number of halogen atoms is reduced to the different free valencies. Unless stated otherwise, preference is given to hydrocarbon chains having 1 to 6 carbon atoms.

Halogenalkyl represents partially or fully halogenated alkyl. In the case of polyhalogenated halogenoalkyl, the halogen atoms can be identical or different. Preferred halogen atoms are fluorine or chlorine, in particular fluorine. If the halogenoalkyl carries further substituents, the maximum possible number of halogen atoms is reduced to the different free valencies. Unless stated otherwise, preference is given to hydrocarbon chains having 1 to 6 carbon atoms.

If appropriate, the compounds of the formula (I) are present as mixtures of various possible isomeric forms, in particular of stereoisomers such as, for example, E and Z, threo and erythro, and also optical isomers. What is claimed is both the use of E and the Z isomers, and also the threo and erythro and the optical isomers, and any mixtures of these isomers.

Preference is given to using compounds of the formula (I) in which

R^1 represents hydrogen or methyl,

R^2 represents hydrogen or C_1 - C_4 -alkyl and

R^3 represents a grouping

in which

A represents oxygen, sulphur or $-(N-R^9)-$ in which

The fact that the active compounds are well tolerated by plants at the concentrations
 35 required for controlling plant diseases permits the treatment of aerial parts of plants,
 of propagation stock and seeds, and of the soil.

The active compounds according to the invention can be employed particularly successfully for controlling diseases in fruit and vegetable growing and viticulture, such as, for example, against *Botrytis*, *Phytophthora* and *Plasmopara* species or rice diseases, such as, for example, *Pyricularia* species.

According to the invention, it is possible to treat all plants and parts of plants. By plants are to be understood here all plants and plant populations such as desired and undesired wild plants or crop plants (including naturally occurring crop plants). Crop plants can be plants which can be obtained by conventional breeding and optimization methods or by biotechnological and genetic engineering methods or combinations of these methods, including the transgenic plants and including plant cultivars which can or cannot be protected by plant breeder certificates. Parts of plants are to be understood as meaning all above-ground and below-ground parts and organs of plants, such as shoot, leaf, flower and root, examples which may be mentioned being leaves, needles, stems, trunks, flowers, fruit-bodies, fruits and seeds and also roots, tubers and rhizomes. Parts of plants also include harvested plants and vegetative and generative propagation material, for example seedlings, tubers, rhizomes, cuttings and seeds.

The treatment of the plants and parts of plants according to the invention with the active compounds is carried out directly or by action on their environment, habitat or storage area according to customary treatment methods, for example by dipping, spraying, evaporating, atomizing, broadcasting, brushing-on and, in the case of propagation material, in particular in the case of seeds, furthermore by one- or multi-layer coating.

Cereal diseases are likewise controlled successfully.

The active compounds according to the invention are also suitable for increasing the harvest yield. Moreover, they show reduced toxicity and are well tolerated by plants.

Depending on their particular physical and/or chemical properties, the active compounds can be converted into the customary formulations, such as solutions, emulsions, suspensions, powders, foams, pastes, granules, aerosols and micro-encapsulations in polymeric substances and in coating compositions for seeds, and ULV cool and warm fogging formulations.

These formulations are produced in a known manner, for example by mixing the active compounds with extenders, that is, liquid solvents, liquefied gases under pressure, and/or solid carriers, optionally with the use of surfactants, that is emulsifiers and/or dispersants, and/or foam-formers. If the extender used is water, it is also possible to employ, for example, organic solvents as auxiliary solvents. Essentially, the following are suitable for use as liquid solvents: aromatics such as xylene, toluene or alkylnaphthalenes, chlorinated aromatics or chlorinated aliphatic hydrocarbons such as chlorobenzenes, chloroethylenes or methylene chloride, aliphatic hydrocarbons such as cyclohexane or paraffins, for example petroleum fractions, alcohols such as butanol or glycol and their ethers and esters, ketones such as acetone, methyl ethyl ketone, methyl isobutyl ketone or cyclohexanone, strongly polar solvents such as dimethylformamide or dimethyl sulphoxide, or else water. Liquefied gaseous extenders or carriers are to be understood as meaning liquids which are gaseous at standard temperature and under atmospheric pressure, for example aerosol propellants such as halogenated hydrocarbons, or else butane, propane, nitrogen and carbon dioxide. Suitable solid carriers are: for example ground natural minerals such as kaolins, clays, talc, chalk, quartz, attapulgite, montmorillonite or diatomaceous earth, and ground synthetic minerals such as highly disperse silica, alumina and silicates. Suitable solid carriers for granules are: for example crushed and fractionated natural rocks such as calcite, marble, pumice, sepiolite and dolomite, or else synthetic granules of inorganic and organic meals, and granules of organic material such as sawdust, coconut shells, maize cobs and tobacco stalks. Suitable emulsifiers and/or foam formers are: for example nonionic and anionic emulsifiers, such as polyoxyethylene fatty acid esters, polyoxyethylene fatty alcohol ethers, for example alkylaryl polyglycol ethers, alkylsulphonates, alkyl sulphates, arylsulphonates, or else protein hydrolysates. Suitable dispersants are: for example lignin-sulphite waste liquors and methylcellulose.

Tackifiers such as carboxymethylcellulose and natural and synthetic polymers in the form of powders, granules or latices, such as gum arabic, polyvinyl alcohol and polyvinyl acetate, or else natural phospholipids such as cephalins and lecithins and synthetic phospholipids can be used in the formulations. Other suitable additives are mineral and vegetable oils.

It is possible to use colourants such as inorganic pigments, for example iron oxide, titanium oxide and Prussian Blue, and organic dyestuffs such as alizarin dyestuffs,

azo dyestuffs and metal phthalocyanine dyestuffs, and trace nutrients such as salts of iron, manganese, boron, copper, cobalt, molybdenum and zinc.

5 The formulations generally comprise between 0.1 and 95 per cent by weight of active compound, preferably between 0.5 and 90%.

10 The active compounds according to the invention can be used as such or in their formulations also mixed with known fungicides, bactericides, acaricides, nematocides or insecticides in order thus, for example, to widen the spectrum of action or to prevent development of resistance. In many cases, synergistic effects are achieved, i.e. the activity of the mixture exceeds the activity of the individual components.

Examples of co-components in mixtures are the following compounds:

5 In addition, the compounds of the formula (I) according to the invention also have very good antimycotic actions. They have a very broad spectrum of antimycotic action, in particular against Dermatophytes and yeast fungi, moulds and diphasic fungi (for example against *Candida* species, such as *Candida albicans*, *Candida glabrata*), Epidermophyton species, such as *Epidermophyton floccosum*, *Aspergillus* species, such as *Aspergillus niger* and *Aspergillus fumigatus*, *Trichophyton* species, such as *Trichophyton mentagrophytes*, *Microsporon* species, such as *Microsporon canis* and *audouinii*. The list of these microorganisms by no means represents a
10 limitation of the mycotic spectrum that can be controlled, but is only of illustrative character.

15 The active compounds can be employed as such, in the form of their formulations or the use forms prepared therefrom, such as ready-to-use solutions, suspensions, wettable powders, pastes, soluble powders, dusts and granules. Application is carried out in a customary manner, for example by watering, atomizing, spraying, broadcasting, dusting, foaming, spreading, and the like. It is furthermore possible to apply the active compounds by the ultra-low-volume method, or to inject the preparation of active compound or the active compound itself into the soil. It is also possible to treat the seed
20 of the plants.

25 When using the active compounds according to the invention as fungicides, the application rates can be varied within a relatively wide range, depending on the type of application. In the treatment of parts of plants, the active compound application rates are generally between 0.1 and 10,000 g/ha, preferably between 10 and 1000 g/ha. In the treatment of seed, the active compound application rates are generally between 0.001 and 50 g per kilogram of seed, preferably between 0.01 and 10 g per kilogram of seed. In the treatment of the soil, the active compound application rates are generally between 0.1 and 10,000 g/ha, preferably between 1 and 5000 g/ha.

Preparation Examples

Example 1:

5 Ethyl 2-{{3-(formylamino)-2-hydroxybenzoyl}amino}-3-(4-hydroxyphenyl)-propanoate

Process b)

10 2.0 g (5.1 mmol) of ethyl 2-[(2-hydroxy-3-nitrobenzoyl)amino]-3-(4-hydroxyphenyl)propanoate were suspended in 60 ml of formic acid and admixed with 2.0 g of Raney nickel. The mixture was stirred at 90°C for 1 hour and then filtered. The filtrate was concentrated and the residue was taken up in dichloromethane and washed with dist. water. The organic phase was dried over sodium sulphate and then
15 concentrated to dryness. Purification was carried out on silica gel using the eluent mixture ethyl acetate/cyclohexane in a ratio of 6:1. This gives 1.34 g (70% of theory) of ethyl 2-{{3-(formylamino)-2-hydroxybenzoyl}amino}-3-(4-hydroxyphenyl)-propanoate.

Preparation of intermediates of the formula (IB)

Example (IV-1)

- 5 Ethyl 2-[(2-hydroxy-3-nitrobenzoyl)amino]-3-(4-hydroxyphenyl)propanoate.

Process d)

- 10 1.78 g (8.0 mmol) of D,L-tyrosine ethyl ester hydrochloride are dissolved in 20 ml of tetrahydrofuran and admixed with 1.1 ml (8 mmol) of triethylamine. At 0°C, 1.61 g (8.0 mmol) of 3-nitrosalicylic acid chloride, dissolved in 25 ml of tetrahydrofuran, are added dropwise with stirring to the reaction mixture. Over the course of 16 hours, the reaction mixture is allowed to warm to room temperature. The precipitated triethylammonium chloride is filtered off and the solution that remains is
- 15 concentrated using a rotary evaporator. The residue is taken up in 200 ml of ethyl acetate and the mixture is extracted with 200 ml of dist. water. The organic phase is subsequently dried over sodium sulphate. The solvent is removed using a rotary evaporator. Purification is carried out over silica gel using the eluent mixture ethyl acetate/cyclohexane in a ratio of 10:1.
- 20 This gives 2.14 g (69% of theory) of ethyl 2-[(2-hydroxy-3-nitrobenzoyl)amino]-3-(4-hydroxyphenyl)propanoate.
HPLC: logP = 2.28
